A COMPARATIVE STUDY OF BUDGETING, FORECASTING, AND PLANNING OF SPORTS ORGANIZATIONS

Ganesh Garge
Symbiosis Institute of Management Studies.

ABSTRACT:
Efficient management of financial resources is important for every effective sport program. The most critical aspects of financial management include the way the finances are being handled, alternatives to expenditure issues and the knowledge of the important aspects of the particular sector. The individual responsible for sports finance should be having accounting expertise and know-how of the political aspects, transparency, risk control and much more. This study focuses on a comparative study of budgeting, forecasting and planning of sports organizations and also specifically points out the key differences between financial planning and budgeting, highlighting the advantages individually and the study has been conducted using past researches.

INTRODUCTION:
The method of budgeting is an essential part of the financial data operation. Budgeting means assigning scarce capital to an organization's prioritized needs. For certain situations, the budget is the official authorization to invest funds on a public agency. The expenditure is also a product of the budgetary phase. (Banerjee, A. (2011). In addition, the budget is an essential method for tracking and evaluating finances and their utilization. The administrators will conduct and monitor operations approved in the budget by using the accounting method to assess the will of the governing body and to analyze the financial results by comparing the budget with the actual activity. The budget is thus indirectly tied to budgetary obligation and explicitly relevant to the GASB’s financial performance targets (Australian Sport Council (2013). For the following purposes, the preparation and control roles of any organization, stress the value of good budgeting practices:

Comprehensive strategic preparation is critical for effective decision-making across a company's scale and complexity. The mechanism of financial planning is crucial to convey citizens' priorities and provides a forum for agreement among residents, representatives of the governing board and the workers on the potential course of the activities of the government entity (Corbin, J.A. & Strauss, A. (2008).

The relation between financial planning and budget management bestows a special position on the budget statement for public bodies. Public budgets are also used as final policy documents,
since an approved budget reflects the government's budgetary strategy to fulfill its priorities and expectations. When a government entity constitutionally adopts a budgetary framework, a portion of the Legislative Council has been given consent which represents the public preferences about which products and services will or will not be delivered by the Government Agency (Creswell, J.W. (2003).

1.1 OBJECTIVES OF BUDGETING:
The performance appraisal encourages people and associations to keep public agencies responsible for their conduct to policy-makers and administrators. Because citizens' responsibility is also specifically specified in federal and local legislation, it is a central component of budgeting and financial reporting. In GASB Principles Section 1, Financial Reporting Priorities, paragraph GASB emphasizes the value of transparency with the following targets (Government Accounting Standards Board (2003a). In order to assess if current-year revenues are appropriate to fund current-year expenses, financial results may include details. Financial reports may indicate when the entity's lawfully approved strategy has collected and utilized money. It should also reflect alignment with other regulatory or statutory conditions relevant to finance. Financial reports can include statistics to help consumers determine the public entity's program activities, expenditures and milestones (Government Accounting Standards Board (2003b).

To accomplish these targets, the budget must be planned on the basis of many transparency principles. Accountability is also accomplished by the integration of these priorities into legislative requirements for state and municipal agency budget. It must be adjusted to provide for the provision of ongoing programs through new revenue Prepare in accordance with all the federal, state and local regulations applicable; and provide the framework for the appraisal of initiatives, expenditures and successes of government service (Le Menestrel, S. & Perkins, D.F. (2007).

Although some kind of financial obligation for long-term fiscal well-being in an entity is usually desirable, adjustments such as usage of Fund balance funds for current programs for a short duration might be acceptable. Any deviations from this basic goal must, therefore, usually be in line with the relevant national and local regulations and policies (Mack, J. & Ryan, C. (2007).

Given the value of showing conformity with the budget accepted, the financial reporting framework must track the utilizing and exceed of financial capital. Accounting methods are typically employed on the same accounting framework for the planning of the negotiated expenditure to show conformity. The real financial evidence obtained by the accounting department is therefore equivalent to the budget accepted. The financial accounting framework is the primary instrument for maintaining financial transparency by budgetary incorporation (Melitski, J. & Manoharan, A. (2014).

Finally, the expenditure is judged on its productivity to meet the specified goals and priorities of the organization. Usually, the evaluation consists of evaluating how the money were invested, the effects of the spending on the assets, and the degree to which the goals mentioned were accomplished. This process is important for the production of the expenditure allocations in the following year. In reality, the creation of the budget is not only a yearly process to decide the
distribution of the funds, but is a part of the on-going period of strategy and assessment to meet the organization's specified priorities and objectives (National Treasury (2011)).

The money is expended differently by place and area, so it is necessary to know how the money is to be invested. Some regions are more concentrated on one event rather than another, or the funding actually is inadequate to support a number of different sports. Strict budgeting may be helpful here. When sports organizations make the budget, try to determine which places use the most funding and reduce needless spending. This frees up the funds for more fitness activities and avoids the over-consumption of the organization (News BBC (2010)).

RESEARCH QUESTIONS:
1. What is the budget estimate of managing a sports organization?
2. What are the forecasting techniques to manage the expenses in managing sports organizations?
3. Is the amount of spending realistic?

To assess if the money expended makes sense, use previous studies. Sports organizations would not have the resources for other opportunities if so much capital is invested on one region. Set aside major expenditures; emergency insurance, petrol and transport vehicles, beverages, restaurants, etc.

Budgeting for the near and medium term:
It is reasonably easy to differentiate between short- and long-term budgeting. In the short term, anything is commonly applied to shorter than a year and in the long term. Short-term bills are anything sports organizations have to compensate for and may not intend to do. This may involve clothing, food and beverages, funds for petrol, benefits, and so on. In comparison, broad training facilities or automobiles may apply to long-term production. Setting a short-term target would then indicate how much funding is remaining in the long-term spending fund. It is important to try to invest sufficiently money for all of them, but it is not always easy.

Predictability:
The first phase in creating an organization is generally preparation which is seen as an aim. Planning may be easy, like designing sports organizations regular schedule, or long enough to see sports organizations company in five or ten years. Any preparation is carried out for the saddle seat with no more empirical data than a market view. (Palmer, D.A. (2012). However, if more detail is accessible, according to the Free Management Library the planning emphasis rises. When the company concept takes shape, a more detailed marketing strategy will be developed to explain who the clients are, where to make the profits and how to recruit new clients. Planning allows the company to utilize capital more effectively and to plot the right path for potential operations (Perkins, D.F., Jacobs, J.E., Barber, B.L. & Eccles, J.S. (2004))

SPORTS COMPANY BUDGETING:
Sports Companies also found a way to invest capital on a budget. Budgets specify the distribution of available financial capital. Budgets are commonly calculated by the way prior funds and profits is invested. Budgets also specify the amount expended on salaries, service and marketing expenditures (Prinsloo, J. & Roos, M. (2006)).
Budgets are most directly linked to behavior in everyday life. Although a schedule or prediction may be incorrect, the financial catastrophe is planned for by a misguided estimate. At the beginning of a fiscal year, most businesses set their expenditures and often allow space for change as sales rise or decrease. Planning is moving hand in hand with budgeting.

However, predictions are never fixed in stone, so a budgeting and estimation illustration will not do right from one company to the next. The estimate could not be right, so a budget centered on that would be an error. However, far from being a pointless activity, estimation serves as a framework for further preparation. Sports organizations should weigh variables beyond sports organizations company, such as market patterns and economic forecasts in general, for the more reliable prediction.

THREE APPLICATIONS:
Financial planning, preparing and forecasting are valuable instruments when operating a business. It needs a roadmap to get it right. The design aims to support the life of the organization. The budget operates directly with the operational side which decides how the near which foreseeable future needs to be accomplished. Forecasting will help to simplify situations well in advance for more efficient and detailed forecasting, but it is as unpredictable as in future.

IMPORTANCE OF FINANCE IN GAMES & SPORTS:
The first phase in recognizing sport finance is to know that sport organizations are corporations. Decisions by management specifically influence the revenue and expenditure of sporting clubs, community, leisure services, physical travel and activity, therapy organizations, and others.

GAMES BUDGET:
The budget balancing is a thorough, time-consuming process. It’s duty belongs to a manager, a financial manager, an accountant or even a coach, budget control is mainly a task of sports managers. Employing and coordinating workers, tracking monthly and annual spending, tracing minor sums of cash and establishing and hitting revenue projections are all part of the financial obligations of management.

IMPORTANCE OF FINANCIAL PLANNING:
Major entities, including the National Football League and the National Basketball Union, are struggling with highly diverse income sources, like profits from Advertising, radio, club ownership, ticket sales, etc. As these organizations are mainly corporations, managers are extremely vigilant to monitor any aspect of revenue and spending. Collegiate athletics officials struggle with common sources of revenue and costs, but they often have to take into account funding contributions from their institutions, scholarship services for low-income households and several other dynamic aspects.

One feature of games financing which many do not realize is that it is not restricted to lucrative games ligas and multi-million-dollar teams. Any sports-related, non-profit organization including parks, leisure or rehabilitation services for sports organizations people at risk often relies on carefully prepared budgets to align revenue sources such as grants and municipal funding with expenditures such as wages, transportation, supplies, food and much more.
Understanding games financing is a crucial factor in order to establish a fruitful career in sports management. Although sports organizations want this profession more from sports organizations sports love than from sports organizations zeal for wealth, financial awareness is vital to the survival of every such company. Candidates with a master's degree in sport management will improve their financial know-how in this thrilling area and become skilled.

**FINANCIAL PLANNING AND STRATEGY IN GAMES:**
The first big move in a sports organization's financial management is to decide the form of enterprise the association is: a corporation, a group, a cooperative or a charity. Finance administration starts by deciding which funds are accessible and how they are distributed. Examining past financial reports is necessary for existing services and implementing a new program plan and budget involves partnering with administrators and key partners to properly manage budgetary capital.

The development of a financial plan means:

- Find existing developments in the individual sports market in which the company or association functions
- Examining internal limitations (influences the organization resulting from previous decisions) against external limits (external factors affecting the organization)
- Cut all expenses, including charges for the location, security, supplies, transport, lodging, publicity, advertising and staff salaries
- Revenue projection categories include subscription dues, seat purchases, gifts and restaurant and clothing revenues
- Organizing financial reports through a report that is accessible and understood for stakeholders
- When they conduct all of these activities, experts in sport finance must take into consideration all the legislation surrounding the budgets of their organizations. Any support activity must be legitimate, and the laws can be upheld while the sport group is part of a broader community.

Any budgetary decision taken should be looked at through a prism of danger and its future gain, including the probability of a substantial gain.

**SPORT COMPANY FINANCIAL OPERATIONS:**
Effective management of sport financing relies on wise choices that optimize profitability for sports organizations. Financial management in sports may imply that finance administrators in an organisation may collaborate with various stakeholders to create wise and productive investment decisions. The strategies used in these debates may include:
Establish effective partnerships with valued suppliers
- Working with organizations, such as good quality sponsorships, that add exposure and benefit to the sport organization
- Find revenue source opportunities, such as the development of a smartphone app that involves app transactions
• Reducing excessive spending and retaining emergency accounts for urgent emergencies or overdue profits
• Although a financial planner may not be willing to play a part in actively carrying out those measures, they frequently assign a budget and determine if choices are appropriate on the basis of patterns and projections for the company.

SPORTS FUNDING AND ANALYSIS:
Sport finance managers calculate all expenditure and monitor the effect on their businesses, allowing them to be responsive and to change their expenditures appropriately. This involves developing options to prepare for financial deficits and constant optimization of investment. The sports finance managers must maintain reliable and comprehensive reports using an effective, up-to-date monitoring method. This can be used to build potential financial forecasts, increase expenditure consistency, and evaluate the achievements and weaknesses which may impact strategic decision-making within an enterprise.

Financial disclosures would still be provided on corporate taxation, which administrators of sport organizations must be mindful of. Amateur sports can be partly financed by taxes, which in some difficult ways lead to budgeting. Based on the condition of the institution as well as on the form of entity and the general membership, the reporting criteria for sport finance can differ. Reports and analyses are utilized for short- and long-term budgeting in the world of sport. Often companies have a long-term view of development, including site capability expansion and training infrastructure upgrades. Documents allow organizations to prepare whether and where they will accomplish these targets.

FACTORs HAVING A ROLE IN SPORTS FINANCE:
Based on the nature of sporting association, financial administrators will often need to consider how the following considerations impact the budgets of the company:

Smaller sporting teams are allowed to use gambling activities as raffles to collect funds and, with the announcement of the National Basketball Association, gambling might eventually play a bigger part of American professional sports.

Media: TV / radio broadcasting needs strategic relationships between the sporting association and the transmitting corporation. External partnerships: marketing products outside a sporting location includes contractual arrangements with suppliers and retailers. As this short summary demonstrates, sport sponsorship covers a wide range of cross-expert regions. Sports organizations will foresee how different variables such as these will influence the income and finances of a company and assess the distribution of funds if sports organizations plan to start this profession. Budgeting and planning allow senior management to devise plans, prepare for the future and coordinate their priorities in the enterprise. Both processes are vital components of the business cycle of every organization, particularly in times of rapid development.

However, budgeting and planning are identical, certain significant variations differentiate them. Financial executives need to consider these disparities such that they can decide what's essential and distribute their capital appropriately. Such companies may also go so far as to delegate budgeting and scheduling to different departments so that each phase maintains a consistent priority. So, what are the priorities, what are the projections, and why are they so critical? In
order to understand their nature and their commitment to corporate performance, let us unpack budgeting and forecasting and discuss the key gaps between them.

DIFFERENCE BETWEEN BUDGETING AND PLANNING:
At a large stage, Budgeting indicates how much resources a business would have to invest for a specified time to produce the expected goals. In the opposite, the forecast is the method of proactively evaluating the expenditure and utilizing both historical and real-time evidence to project the performance of these companies. In other terms, the budget is a path chart that illustrates significant financial leverage points at each step of the company trip. But once this process is underway, the conditions are normal to alter, essentially outdated the initial assumptions made when the budget was developed. The best practices for strategic finance departments consist of constantly updating the spending strategies of the organization against evolving market conditions, predicting the figures and adjusting appropriately.

2. LITERATURE REVIEW:
Budgeting is the practice of preparing for a given time the profits and expenditures of a business. It includes determining the cash flows available and allocating financial capital for the appropriate expenditures of the business.

The budget is used to plan the company's path and to help management in the execution of plans. The method results in a specific schedule that represents the financial priorities of the company. These are the key features of an organizational budgeting process:

The method normally requires three to six months with an annual project. At the close of the year, comprehensive accounting statements, such as the tax estimate, balance sheet and cash flow analysis, are published. The budget offers calculation criteria for management to monitor financial success. The expenditure is frequently linked to the current financial statements of the business, which offer an analysis of the company’s success in real time. A differential study of the real income statement vs the budget statement is a clear illustration. Employee pay in the organization is measured by the budgeting process, and also compensates employees on the basis of their budget results. The proposal is not usually reported to third actors.

BUDGETING GAINS:
Budgets are normally updated every year to offer valuable input as to what sports organizations should plan to achieve during this year. Adequate budgeting has several other advantages, including, The budgeting method requires management to take a careful look at all the financial operations of the organization and determine the feasibility of each particular expenditure. Budgeting includes in-depth analysis of both revenue streams and uses to reliably predict cash flows. Because budgeting normally begins from below, several workers are interested. This gives workers a feeling of pride and is more driven to accomplish their desired objectives. However, since budgets are planned too early, they can be obsolete since soon as the projections adjust in advance and rely on a predetermined collection of projections.

FORECASTING:
According to Kotler(2016), forecasting is the method of utilizing historical evidence and management experience to forecast potential market performance of an organization. Done
within a short time period, the projection focuses on key income and spending products. The prediction is done periodically after filing, usually right after a month-end or quarter-end. The time period is usually limited and ranges from days to weeks. Generally, the estimates display simplified income and spending predictions. The main success indicators are modified according to projected figures to offer an analysis of how the organization operates.

True income estimates are generally not associated with the prediction. Instead, the actuals are used to forecast financial outcomes. Normally, projections should not cause executive pay. Publicly traded corporations shall report to customers their high-level estimates. The rolling forecast (discussed below) often draws on the latest financial details and thus provides decision-makers with accurate, appropriate and useful knowledge.

**FORECAST ADVANTAGES FOR SPORTS ORGANIZATIONS:**
When the correct analysis is handled successfully, empower management teams predict with the knowledge they need to make strategic business decisions. There are also other drawbacks of estimation, including:

- Precise sales and spending projections allow management to change the company’s course, when the expected patterns validate those behavior.
- Knowing where potential investment is expected to fluctuate simplifies the control of cash flows and capital needs.
- Sports organizations will maximize funding and investment prospects by providing the customers with realistic and timely predictions.
- Sports organizations should reassign all human and financial capital to where the predictions really require them.
- Sports organizations projections will also lead to the next budgeting phase by utilizing the results as the conceptual base for the budget.
- The forecast helps management to concentrate on where appropriate, especially in the short term.
- Static, daily projections are useful, since they typically prepare only for the end of the current fiscal year. On the other side, rotating projections are much more valuable when they use up-to-date financial details and move past this period. Rolling projections are used per month or quarter to prepare for a duration outside the reach of the budget, such as the next five quarters. Instead of predicting the close of the fiscal year, most rotating projections are also projected to last the next 12 months or longer. In addition to all the advantages of static projections, rolling projections are critical for the following reasons:

Businesses planning constant rotating projections are more educated regarding developments in the market, environment and other variables, helping them to recognize and reduce uncertainties and capital distribution. Rolling forecasts utilize real-time data such that they are reliably important. Sports organizations may adjust the prediction with up-to-date data, especially as the method is combined with forecasting software and other business applications. This interface also provides on-demand predictions that enable consumers to gain access to better market information and rapidly react to time-sensitive circumstances.
KEY DIFFERENCES BETWEEN BUDGETING AND FORECASTING:
Budgeting and forecasting are not the same as previously mentioned. Even the tasks relevant to this are distinctive –
- with varying dates,
- planning periods,
- usage cases and
- reporting criteria

CONCLUSION:
The value of budgeting and planning cannot be overestimated in the corporate environment. Budgeting helps managers to develop potential targets and planning allows financial departments the ability to consider problems in a realistic manner. Both are complimentary and essential. And if the proposal is cut down as soon after it has been released, this mechanism ensures accountability across agencies and encourages staff to be accountable for what they are. And when budgeting is low, estimates take over. The forecast offers prompt and reliable financial forecasts that direct policy changes even after the completion of the year. Individual businesses often struggle with budgeting and forecasting various processes, but for everyone, budgeting and forecasting can be best supported by combining the processes into software which enhances precision, timeliness and reliability.
